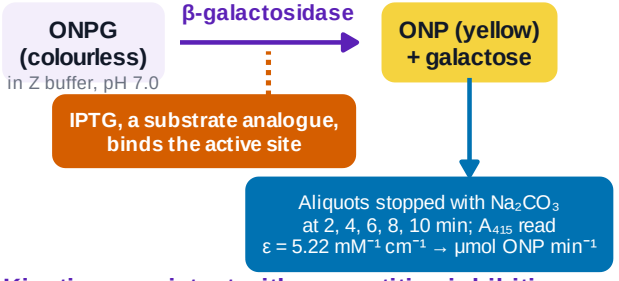
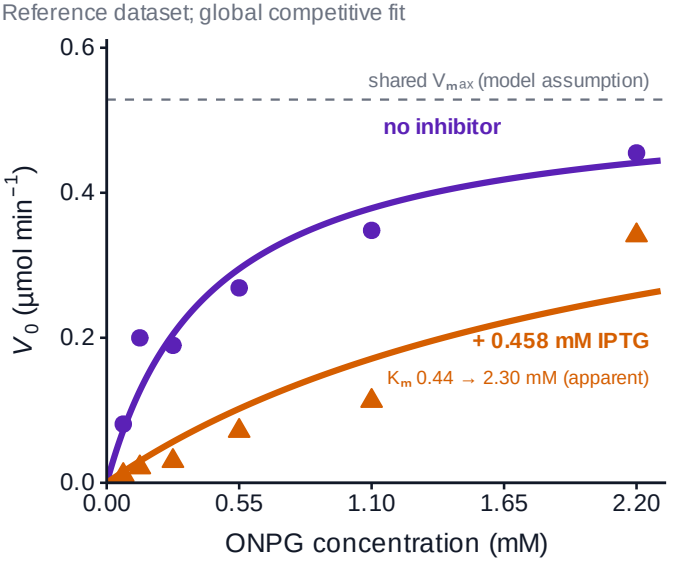
Stopped-reaction spectrophotometry of β-galactosidase: substrate saturation and kinetic behaviour consistent with competitive inhibition by IPTG



Kinetics consistent with competitive inhibition

V_0 approximately ∝ enzyme (R^2 = 0.97)

K_m = 0.31 mM, V_{max} = 0.48 µmol min⁻¹

+ 0.458 mM IPTG: apparent K_m ×5.6


K_i = 0.10 mM by the course method; other estimators 0.11–0.50 mM (method-dependent; purified enzyme 0.08 mM
